ASTERIX

18/09/2025

¿WHAT IS ASTERIX?

*All-purpose **s**tructured **E**UROCONTROL surveillance **i**nformation **e**xchange*

ASTERIX is a set of documents defining the low level ('down to the bit') implementation of a data format used for exchanging surveillance-related information and other ATM applications.

ASTERIX is designed for communication media with limited bandwidth. This is why it follows rules that enable it to transmit all the information needed, with the smallest data load possible.

Eurocontrol ASTERIX

LET'S START WITH ASTERIX!

All the information in these slides is extracted from Eurocontrol Specifications documents. This presentation is only a brief explanation of ASTERIX. To know more about the topic check these documents uploaded in ATENEA.

3.1 Definitions

For the purposes of this EUROCONTROL Specification, the following definitions shall apply:

3.1.1	Catalogue of Data Items:	List of all the possible Data Items of each Data Category describing the Data Items by their reference, structure, size and units (where applicable).
3.1.2	Data Block:	Unit of information seen by the application as a discrete entity by its contents. A Data Block contains one or more Record(s) containing data of the same Category. This principle is used until and including edition 2.1 of Part 1.
3.1.3	Data Category:	Classification of the data in order to permit inter-alia an easy identification.
3.1.4	Data Field:	Physical implementation for the purpose of communication of a Data Item, it is associated with a unique Field Reference Number and is the smallest unit of transmitted information.
3.1.5	Data Item:	The smallest unit of information in each Data Category.
3.1.6	Record:	A collection of transmitted Data Fields of the same Category preceded by a Field Specification field, signalling the presence/absence of the various Data Fields
3.1.7	User Application Profile:	The mechanism for assigning Data Items to Data Fields, and containing all necessary information which needs to be standardised for the successful encoding and decoding of the messages.

Source Eurocontrol

Organisation of the Data (4.2)

The data exchanged over the communication medium between the different users shall be classified into Data Categories.

The purpose of such a classification shall be to:

- Allow easy identification and subsequent processing of the data*
- Facilitate the dispatching of the data to the appropriate application task in the receiving unit*

Up to 256 Data Categories defined:

- Data Categories 000 to 127 for standard civil and military applications;*
- Data Categories 128 to 240 reserved for special civil and military applications;*
- Data Categories 241 to 255 used for both civil and military non-standard applications*

Data Items and Catalogue of Data Items (4.2.2-4.2.4)

A Data Item is the smallest unit of information defined and standardised. For each Data Category, a Catalogue of Data Items shall be standardised

Each Data Item shall be given a unique reference which unambiguously identifies this item in the relevant catalogue

The Data Item symbolic reference shall consist of an eight-character reference of the form Innn/AAA, where:

- I indicates that this represents a Data Item;*
- nnn is a three digit decimal number which indicates the Data Category to which this Data Item belongs (000 to 255);*
- AAA is a three digit decimal number which indicates the data item.*

For the purpose of communication, the various Data Items shall be assigned to Data Fields, each having a length of an integral number of octets and referenced by a Field Reference Number (FRN).

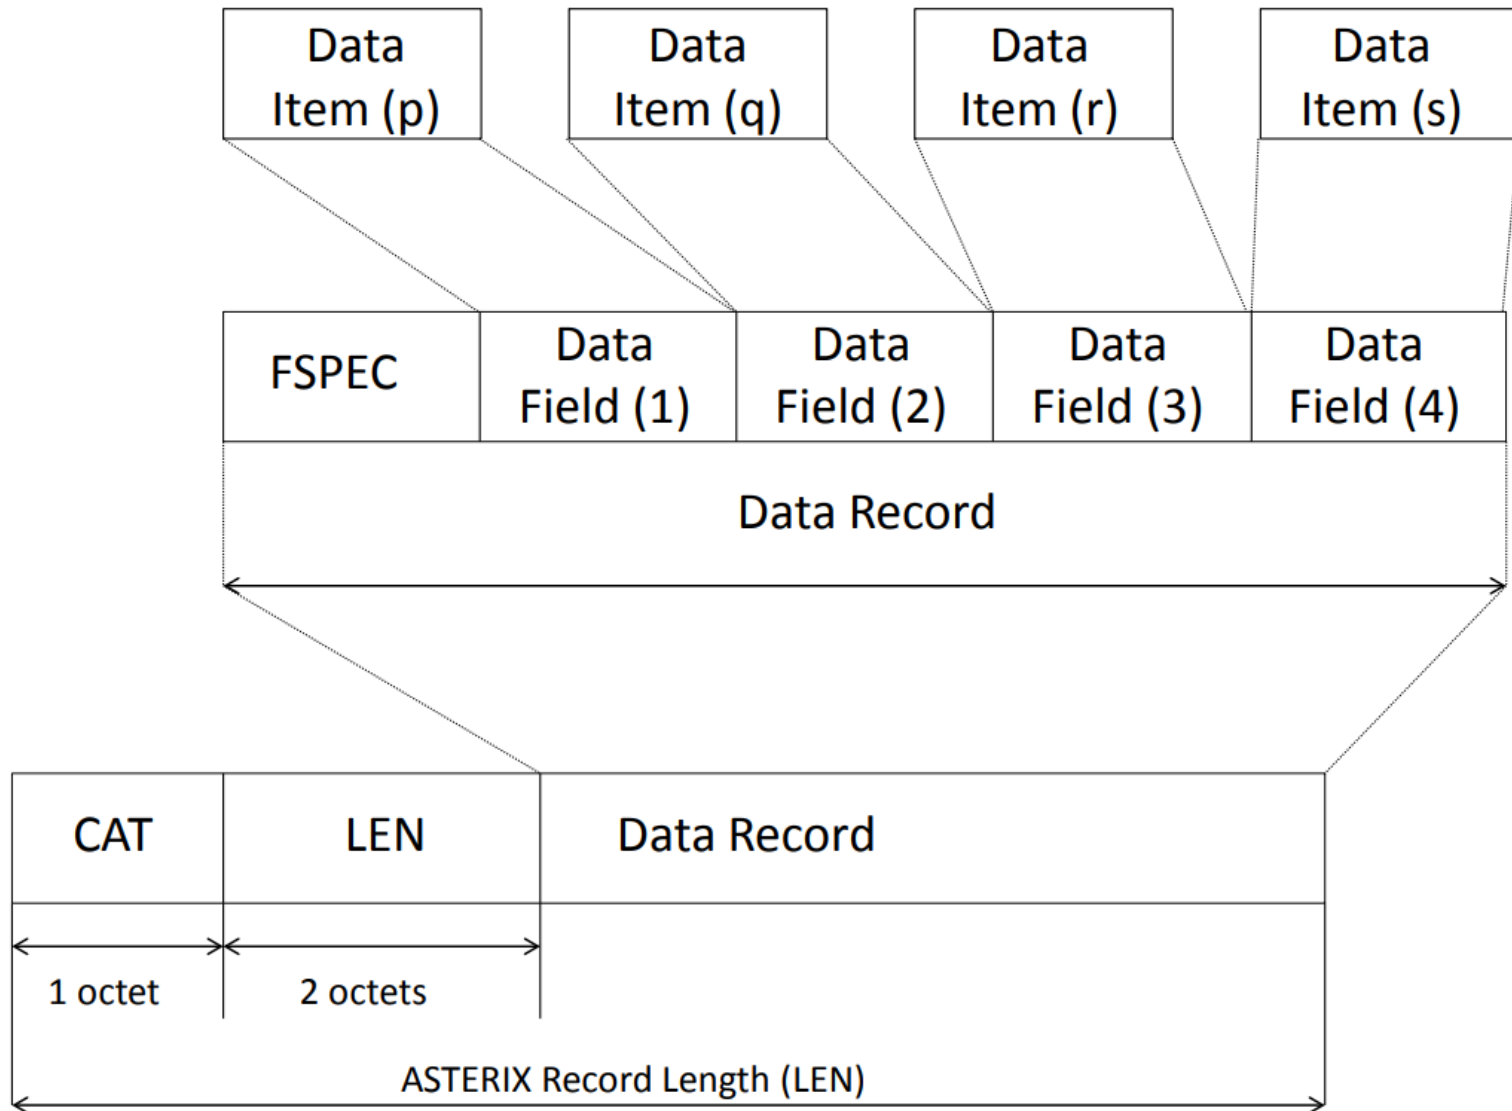

The correspondence between Data Items and Data Fields shall be standardised for each relevant application by the User Application Profile (UAP). The UAP should be unique per Category

Examples of Data Items and Catalogue of Data Items

Data Item Ref. No.	Description	Data Item Reference Number	Description	Data Item Ref. No.	Description
I034/000	Message Type	I021/008	Aircraft Operational Status	I048/010	Data Source Identifier

The General Message Structure (4.3)

Standard Data Field Formats (4.3.4)

The length of Standard Data Fields shall be either fixed or variable, as defined below:

-Fixed length Data Fields shall comprise a fixed number of octets.

n Octets

-Extended length Data Fields being of a variable length, shall contain a primary part of predetermined length, immediately followed by a number of secondary parts, each of predetermined length. The presence of the next following secondary part shall be indicated by the setting to one of the Least Significant Bit (LSB) of the last octet of the preceding part (either the primary part or a secondary part). This bit which is reserved for that purpose is called the Field Extension Indicator (FX).

Repetitive Data Fields, depicted in Figure 3, being of a variable length, shall comprise a one-octet Field Repetition Indicator (REP) signalling the presence of N consecutive sub-fields each of the same pre-determined length.

Standard Data Field Formats (4.3.4)

The length of Standard Data Fields shall be either fixed or variable, as defined below:

-Compound Data Fields, depicted in Figure 4, being of a variable length, shall comprise a primary subfield, followed by data subfields. The primary subfield determines the presence or absence of the subsequent data subfields. It comprises a first part of one octet extendible using the Field Extension (FX) mechanism. The definition, structure and format of the data subfields are part of the description of the relevant Compound Data Item. Data subfields shall be either fixed length, extended length, explicit length or repetitive, but not compound

Primary Subfield

Octet No.1							
8	7	6	5	4	3	2	1
SF1	SF2	SF3	SF4	SF5	SF6	SF7	FX

bits-8/2	(SF n)	= 0	Absence of Subfield n
		= 1	Presence of Subfield n
bit-1	(FX)	= 0	End of Primary Subfield
		= 1	Extension of Primary Subfield into next octet

Data Subfield No 1

Octet No.1								Octet No.2							
16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1
Item of Information 1															

.

.

.

Data Subfield No 7

Octet No.1							
8	7	6	5	4	3	2	1
Item of Information 7							

Field Organisation (4.3.7)

In a Record, Data Fields shall be sent in the order of increasing FRNs

The minimum length of the FSPEC field shall be one octet, which allows the composition of Records consisting of any combination of Data Fields with FRNs from one up to and including seven

When Data Fields with FRNs greater than seven have to be transmitted the FSPEC extension mechanism shall be used. The LSB in the FSPEC field is called the Field Extension Indicator (FX)

STRUCTURE OF THE FIELD SPECIFICATION (FSPEC)

STRUCTURE OF THE FIELD SPECIFICATION (FSPEC)

EXAMPLE OF ONE-OCTET FSPEC

EXAMPLE OF A MULTI-OCTET FSPEC

Overall record structure example

Conventions (5)

All bit positions within a one octet field shall be numbered right to left from one to eight.

For a field consisting of n octets (with $n > 1$):

The octets shall be numbered left to right from one to n ;

The bit positions shall be numbered right to left from one to $n \times 8$.

With an FSPEC field the following exceptions for bit positions shall apply:

In a one-octet FSPEC the bits will be numbered left to right from one to eight;

In a FSPEC consisting of p octets (with $p > 1$) the bits will be numbered left to right from one to $p \times 8$.

Negative values shall be represented in two's complement form.

Time stamping shall be expressed as Co-ordinated Universal Time (UTC)

ASTERIX ADDRESSING SCHEME (6)

In order to avoid ambiguity, every system shall have a unique identification in an area where ASTERIX is used for the exchange of data.

To allow for flexible adaptation of the system configuration to user requirements, virtualisation of an ASTERIX system shall be permitted resulting in the allocation of more than one SIC to a physical ASTERIX system. The allocation of the SAC remains the responsibility of the AMG (ASTERIX Maintenance Group)

The ASTERIX System Identifier format shall be composed of two subfields as illustrated below:

	Field Name	Element Type	Field Size
SAC	System Area Code	Binary	One octet
SIC	System Identification Code	Binary	One octet

ASTERIX ADDRESSING SCHEME (6)

In order to avoid ambiguity, every system shall have a unique identification in an area where ASTERIX is used for the exchange of data.

System Area Code (SAC)

The SAC field shall consist of an eight-bit number assigned to a geographical area or a country.

The SAC field format shall be as:

where b represents a binary digit

System Identification Code (SIC)

The SIC shall consist of an eight-bit number assigned to every system (surveillance station, processing system, server, etc.) located in the geographical area or country defined by the SAC.
